

Ocean Abundance Projections and Prospective Harvest Levels for Klamath River Fall Chinook, 2006 Season

Klamath River Technical Advisory Team
15 February 2006

Executive Summary

Predictor performance for 2005 and forecasts for 2006 are:

		2005			
	Age	Preseason	Postseason	Pre/Post	2006 Forecast
Ocean Abundance	3	185,700	209,500	0.89	44,100
	4	48,900	34,800	1.41	63,700
	5	5,200	7,400	0.70	2,200
Proportion Natural	3	0.54	0.51	1.06	0.67
	4	0.55	0.41	1.34	0.55
	5	0.72	0.71	1.01	0.72
Ocean Harvest Rate	4	0.08	0.24	0.33	---
Ocean Fall Harvest	3	---	0	---	---
	4	---	4,269	---	---
	5	---	1,867	---	---

The implications of the 2006 forecast ocean abundances, proportions natural, and the 2005 ocean fall harvest for fisheries management in 2006 were explored with the Klamath Ocean Harvest Model (KOHM) under two hypothetical management scenarios: (A) no additional ocean fisheries (commercial and recreational) from Jan–Aug 2006 between Cape Falcon and Point Sur (an estimated 6,136 Klamath River fall Chinook were harvested in the ocean during the Sept–Nov 2005 period) and no Klamath River fisheries (tribal and recreational) in 2006, and (B) status quo regulations: the 2005 ocean fishery seasons and quotas, the 2005 river recreational allocation of 15% (of nontribal harvest), and a tribal allocation of 50% (of total harvest). The results are:

Sector	KOHM Forecasts	
	(A) No-fishing in 2006	(B) 2005 Regulations
Adult Spawners		
Natural Areas	29,200	18,700
Hatcheries	21,500	13,500
Adult Harvest		
Ocean Commercial	5,500	8,400
Ocean Recreational	700	1,900
River Recreational	0	1,800
Tribal	0	12,200
Age-4 Ocean Harvest Rate	0.07	0.12
Spawner Reduction Rate	0.10	0.42

Thus, even with no further fishing in 2006 on the current stock, the expected number of natural area adult spawners would be 29,200, with an expected age-4 ocean harvest rate of 7% (due to ocean harvest that already occurred in the Sept–Nov 2005 period). A repeat of 2005 fishery regulations would be expected to

result in 18,700 natural area adult spawners and an age-4 ocean harvest rate of 12.2%. These "expected" numbers were derived from contact rate per unit effort and effort per day predictors based on long term time series of these quantities. Were these predictors to be more heavily weighted toward recent year data, the forecast number of spawners and harvest rate would be even less optimistic. These forecasts are provided for informational purposes only; the Pacific Fishery Management Council (PFMC) will adopt 2006 ocean salmon fishery management regulations in April 2006.

If the postseason estimate of natural area adult spawners in 2006 is less than 35,000, it would be the third consecutive year of failing to meet the PFMC Salmon Fishery Management Plan (FMP) conservation objective for the stock. Under the terms of the Salmon FMP, this would trigger an overfishing concern and require the PFMC to undertake an overfishing review, which would likely lead to the development a rebuilding plan for the stock.

Introduction

The PFMC's (1988) fishery management plan for Klamath River fall chinook (Amendment 9) permits a natural spawner reduction rate via fisheries of no more than 2/3, with a minimum escapement of 35,000 natural area adult spawners (Prager and Mohr 2001). Natural area adult spawners are defined as age-three or older fall chinook that spawn outside of the hatchery environment, regardless of their origin. The KOHM is used by the PFMC to forecast the impacts of ocean and river fisheries on Klamath River fall chinook, and to evaluate whether a given management option is expected to meet the fishery management plan's biological goals for Klamath River fall chinook. The KOHM requires forecasts of Klamath River fall chinook ocean abundance and proportion of natural spawners by age, along with the estimated harvest of these fish in the previous calendar year's September through December (fall) ocean fisheries. This report presents these forecasts and estimates for the 2006 management year. For informational purposes, KOHM forecasts of harvest and spawner escapement also are presented under two hypothetical management scenarios: (A) no ocean or river fisheries in 2006, and (B) status quo regulations: the 2005 ocean fishery seasons and quotas, the 2005 river recreational allocation of 15% (of nontribal harvest), and a tribal allocation of 50% (of total harvest). Historical records of ocean abundance, harvest, harvest rates, river escapement, and predictor performance are also compiled. These records differ from those presented in KRTAT reports issued prior to 2002 for reasons described in KRTAT (2002) and Goldwasser et al. (2001).

Data and Analytical Methods

The age-composition of the 2005 river run of Klamath River fall chinook salmon used in this report is from the KRTAT (2006).

Ocean Abundance Forecast

The age-specific ocean abundance predictors are based on the use of "sibling regression". The age a September 1 ocean abundance estimates for brood years 1979–2001 were regressed against the age $a-1$ river run-size estimates of their respective cohorts (Table 1, Figure 1). By convention, September 1 is the date that immature Klamath River fall chinook remaining in the ocean are incremented one year in age. The regressions were fit using least-squares with the y-intercept constrained to zero, which gives the biologically reasonable expectation that an age $a-1$ river run-size of zero predicts an age a ocean abundance of zero. This procedure is consistent with recommendations of the PFMC's Salmon Technical Team, and Scientific and Statistical Committee.

Ocean abundance has been forecast preseason since 1985 using methods similar to those described above (Tables 2 and 3). Postseason ocean abundance estimates were calculated using cohort reconstruction methods that accommodate spatial and/or temporal variations in maturity, straying, and fishery impact rates applied separately to the hatchery and natural components of the stock. The postseason estimates for 2004 (age-three) and 2005 (age-three, age-four) are preliminary, as their respective cohorts are incomplete (Table 1).

The 2005 age-three ocean abundance forecast was 0.89 times its postseason estimate (Table 2); the age-three predictor has underestimated abundance in 12 of the 21 previous years. The 2005 age-four ocean abundance forecast was 1.40 times its postseason estimate (Table 2); the age-four predictor has underestimated abundance in 9 of the 21 previous years. The 2005 age-five ocean abundance forecast was

0.70 times its postseason estimate (Table 2); the age-five predictor has underestimated abundance in 12 of the 19 previous years.

Proportion of Natural Spawners Forecast

The age-specific proportion of natural area spawners is also forecast using “sibling regression”. In this case, the age a observed proportion natural for calendar years 1997–2005 were regressed against the age $a-1$ observed proportion natural of their respective cohorts (Table 4, Figure 2). Data for calendar years prior to 1996 were not used because: (1) at this time the hatcheries did not always have an “open-door” policy (some fish were denied entry into the hatcheries and presumably spawned in natural areas); and (2) the proportion natural time-series (Figure 2a) indicates a “shift-point” near 1995–1996. The regressions were fit using ordinary least-squares for age-three and age-four. For age-five, the slope of the relationship was insignificant, and the arithmetic mean was used as the predictor.

The 2005 proportion natural forecast for age-three, -four, and -five fish was 0.54, 0.55, 0.72, respectively, and the corresponding post-season estimates are 0.51, 0.41, 0.71, respectively (Table 4).

Historical Harvest Levels and Rates

Historical (1986–2005) ocean and river harvest levels and rates of age-three and age-four Klamath River fall chinook are listed in Table 5. The 2005 age-four ocean harvest rate was forecasted to be 7.7% (PFMC 2005); its (preliminary) postseason estimate of 23.9% is substantially higher than that.

2005 Ocean Fishery Fall Harvest

Klamath River fall chinook ocean harvests during the 2005 fall period are estimated postseason through expansion of the coded-wire tags (all release types) recovered in those fisheries. Each coded-wire tag recovery is expanded for sampling and mark-rate, and then to account for the harvest of natural-origin fish, further expanded by the estimated basin-wide escapement (hatchery- plus natural-origin) per hatchery-origin fish observed in the river run just prior to these fall fisheries (same brood and calendar year).

2006 Forecasts

The 2006 forecasts of ocean stock abundance and proportion natural area spawners are (Figures 1 and 2):

Age	Abundance	Proportion Natural
3	44,100	0.67
4	63,700	0.55
5	2,200	0.72

For the 2005 ocean fall fisheries, the natural production multipliers for the coded-wire tag recoveries are:

Age (a)	Total Escapement (a-1)	Hatchery-origin Escapement (a-1)	Natural-production Multiplier (a)
3	2,299	188	12.23
4	43,870	25,780	1.70
5	17,513	11,482	1.53

The fishery-area-month-age-specific estimated harvests are presented in Table 6. These estimated fall landings will be accounted for in ocean fisheries harvest allocation in 2006, and the associated harvest impacts will be deducted from the September 1 ocean abundance forecasts.

KOHM principal forecast results under two management scenarios: (A) no additional ocean fisheries (commercial and recreational) from Jan–Aug 2006 between Cape Falcon and Point Sur (an estimated 6,136

Klamath River fall Chinook were harvested in the ocean during the Sept–Nov 2005 period) and no Klamath River fisheries (tribal and recreational) in 2006, and (B) status quo regulations: the 2005 ocean fishery seasons and quotas, the 2005 river recreational allocation of 15% (of nontribal harvest), and a tribal allocation of 50% (of total harvest); are provided in Appendices A and B, respectively.

a/ Original preseason forecast for years 1986-2001 were for May 1(t); converted to Sept 1 (t-1) forecasts by dividing the May 1(t) number by the Sept 1(t-1) through May 1(t) survival rate presumed by modelers in those years: 0.5 age-three, 0.8 age-four, 0.8 age-five.

b/ Ocean harvest rate forecast is the fraction of the predicted ocean abundance expected to be harvested Sept 1 (t-1) through Aug 31 (t). River harvest rate forecast is the fraction of the predicted river run expected to be harvested in river fisheries. Original ocean harvest rate forecasts for year(t), 1986-2001, were based on a May 1(t) ocean abundance denominator; converted to Sept 1(t-1) abundance denominator by multiplying former values by 0.8 (the age-four survival rate between Sept 1 (t-1) and May (t) presumed by modelers in those years.

c/ Ocean harvest rate is the fraction of the postseason ocean abundance harvested Sept 1(t-1) through Aug 31(t). River harvest rate is the fraction of the river run harvested by river fisheries.

d/ Preliminary.

a/ Preliminary data (incomplete cohort).

b/ Ocean harvest rates are the fraction of Sept 1(t-1) ocean abundance harvested in these fisheries. River harvest rates are the fraction of the river run (t) harvested in these fisheries.
